TCR INSPIRED Changes: What you need to know

Ofgem's Targeted Charging Review (TCR) will introduce further changes to invoice charges from the 1st April 2023. Here's everything you need to know to get prepared.

TNUoS charges: What's changing?

Today:

These costs cover maintaining the electricity supply networks. A significant proportion of your TNUoS charges are based on the amount of energy you use during Triad periods (the three periods of peak winter demand).

From April 1st 2023:

Any pass through contracts will begin to see an introduction of a TNUoS standing charge and a reduction in TNUoS unit rates from the 1st April 2023. Many businesses will see an increase in their energy bill as a result of this change.

Reduce the impact on your energy bills:

Determine if your ASC is set at the optimal level which meets both your present and future needs. Not only will you make immediate savings but there are now additional significant benefits as a result of an ASC reduction due to the way sites are charged now and from April 2023.

BSUoS charges: What's changing?

Today:

Balancing Services Use of System (BSUoS) refers to the charges recovered by the National Grid to balance the transmission system which transports electricity from power generators to consumers. At present, BSUoS charges are paid by both consumers and generators.

From April 1st 2023:

Businesses can expect to see a change in the level of **BSUoS charges**. The BSUoS costs will no longer be split between generators and suppliers which means the end user will be liable for these charges.

Reduce the impact on your energy bills:

BSUoS charges are estimated to increase by around 70-80%.

Ensure you are being charged correctly and look at ways to reduce your overall consumption to mitigate the cost impact.

Need some expert support?

Our energy specialists are on hand to help you make sense of the TCR changes and what they mean for your business. **Contact us on:**
